CRITICAL INCIDENT — RESOLVED

INC-2840 — Lagos West Power Cluster Failure

Executive Summary

A grid failure from IKEDC Sector 7 feeder resulted in a cascading outage across Lagos West cluster. Three towers went offline within 90 seconds, impacting approximately 38,400 subscribers. Auto-genset failover was inhibited on two sites due to active maintenance flags.

Incident Timeline

Time	Event	Actor
14:12	Grid alarm detected	System
14:13	TWR-LAG-W-014 offline	System
14:14	Auto-genset inhibited (maintenance flags on 2 sites)	System
14:21	Manual genset start completed	field-team-1
14:27	All towers restored	NOC

Root Cause Analysis

The outage was triggered by a feeder fault on IKEDC Sector 7 grid. Compounding the impact, maintenance flags on two tower sites prevented automatic genset activation, resulting in prolonged downtime until manual intervention.

Impact Assessment

Tower	Signal %	Load %	Subscribers Impacted
TWR-LAG-W-014 (Surulere)	0%	0%	12,800
TWR-LAG-W-022 (Mushin)	0%	0%	13,200
TWR-LAG-W-031 (Yaba North)	0%	0%	12,400

Resolution

Manual genset activation was performed by field-team-1 across affected sites. IKEDC Network Operations Centre was notified via API integration for feeder fault acknowledgment and escalation. Service restoration confirmed across all impacted towers.

Policy Change

All clusters with more than two towers connected to the same feeder must maintain a minimum of 12-hour fuel reserve to ensure extended genset operation during grid instability.
